Cluster Analysis

Sorting objects in such a way that items in the same group are more similar to each other than to those in other groups.

Approaches to Cluster Analysis

- Partitioning algorithms
- Hierarchical algorithms
- Model based algorithms
- Mean shift algorithms

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Partitioning Algorithms

Data:
$$\{\mathbf{x}_1, \mathbf{x}_2, ..., \mathbf{x}_n\}$$
 , $\mathbf{x}_i \in R^p$

Means: $\mu_1, \mu_2, ..., \mu_K$

Distances:

$$d_{i} = d\left(\mathbf{x}_{i}, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}, ..., \boldsymbol{\mu}_{K}\right) = \min_{1 \leq k \leq K} D\left(\mathbf{x}_{i}, \boldsymbol{\mu}_{k}\right)$$

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Partitioning Algorithms

Cluster Centers

$$\left(\widehat{\mu}_{1},,...,\widehat{\mu}_{\mathcal{K}}
ight)=$$
 arg min $\mathcal{T}\left[d\left(\mathsf{x}_{1},\mu_{1},...,\mu_{k}
ight),...,d\left(\mathsf{x}_{n},\mu_{1},...,\mu_{k}
ight)
ight]$

Clusters

$$C_{k} = \left\{ \mathbf{x}_{i} : D\left(\mathbf{x}_{i}, \widehat{\boldsymbol{\mu}}_{k}\right) = \min_{1 \leq l \leq K} D\left(\mathbf{x}_{i}, \widehat{\boldsymbol{\mu}}_{l}\right) \right\}$$

K-Means

$$D(\mathbf{a}, \boldsymbol{b}) = \left[\sum_{j=1}^{p} (a_j - b_j)^2\right]^{1/2} = \|\mathbf{a} - \boldsymbol{b}\|_2 \qquad (\mathsf{L}_2 \text{ distance})$$

$$T(d_1,...,d_n)=\frac{1}{n}\sum d_i^2$$

<□ > < @ > < E > < E > E のQ @

K-Mediods

$$D\left(\mathbf{a}, \boldsymbol{b}
ight) = \sum_{j=1}^{p} |a_i - b_j| = \|\mathbf{a} - \boldsymbol{b}\|_1$$
 (Manhattan Distance)

$$T(d_1,...,d_n)=\frac{1}{n}\sum d_i$$

K-Tau

$$D(\mathbf{a}, \boldsymbol{b}) = \left[\sum_{j=1}^{p} (a_i - b_j)^2\right]^{1/2} = \|\mathbf{a} - \boldsymbol{b}\|_2 \qquad (\mathsf{L}_2 \text{ distance})$$

$$T(d_1,...,d_n) = s^2 \frac{1}{n} \sum \rho\left(\frac{d_i}{s}\right)$$

 $s = Med(d_i)$

The Number of Clusters

Estimating the number G of clusters is one of the most difficult problems in cluster analysis

- A common approach: try different values of G and choose the one that maximizes the clusters strength.
- Cluster strength can be measure in several ways:
 - Silhouette
 - Gap statistics
 - Graphical approach (elbow in the interclass sum of squares plot)

Mean Shift Algorithms

- Strategy: iteratively move the data points toward the cluster centers.
- ► The number of different limiting points is an estimate for *G*.
- Example: in gravitational clustering data points are viewed as particles of unit mass and zero velocity attracted toward cluster centers by gravitational forces.

Number of Clusters = Number of Fix Points

Attractors

- Peña, Viladomat and Zamar (2012) present an algorithm ATTRACTORS – to move observations toward cluster centers
- Iteratively, observations move to the location of its nearest-neighbors median approaching several fix points

$$m_0 = x_i$$
 (data point)

 $A_I = \{k \text{ nearest neighbors of } m_I\}$

$$m_{l+1} = Median_{x_j \in A_l} \{x_j\}$$

The sequence of local medians m_l move toward the peaks and away from the valleys of the data density

Attractors Domains

$$g(x) = F^{-1} \left[F(x-d) + \frac{\alpha}{2} \right]$$
$$F(x+d) - F(x-d) = \alpha$$
$$x_{(m+1)} = g(x_m)$$

Fisher's Iris Datas

Projection on Setal Length and Width

・ロト ・聞ト ・ヨト ・ヨト

æ

Ring - Synthetic Data

Clusters Around Lower Dimensional Hyperplanes

- Traditional cluster centers are points
- Points are zero-dimensional hyperplanes
- Van Aelst, Wang, Zamar and Zhu (2006) propose an algorithm to find clusters around low dimensional hyperplanes (points, lines, planes, etc)
- The proposed algorithm is called Linear Grouping Algorithm (LGA)
- Garcia-Escudero, Gordaliza, San Martin, Van Aelst and Zamar (2009) develop a robust version

Application to Allometry

- Biologists investigate the relationships between sizes of organs for different species.
- Generally, when the size of one organ is large the size of other organs is also large
- For example, a larger body also requires a larger brain. These relations are driven by the evolution process.

Brain Weight and Olfactory Bulb Volume

Data for 83 mammal species (log scale) kindly provided by Dr. Jerison (UCLA)

э

Application to Allometry

- Typically, there exists a linear association between the sizes of organs
- The linear associations are not the same across different classes of species because of different living habits, environment, food sources, etc.
- Different mammal species developed their smell senses according to their living environment, food searching, danger identifying needs, etc.

 Hence, clustering according to different linear patterns is necessary (a job for LGA).

Application to Allometry

- Automatic methods to decide the number of clusters yield 2 groups as the optimal number.
- Hence, without using external biological knowledge we would choose k = 2 groups

Two Linear Clusters

Two Linear Clusters

Group 1	Group 2
insectivores	monkeys
carnivores	apes
horses	human
prosimians	

Dr. Jerison Proposes Three Clusters

Group 1	Group 2	Group 3
insectivores	prosimians	monkeys
carnivores		apes
horses		human

Three Linear Clusters

LGA with k = 3 finds Dr. Jerison's linear clusters

Satellite Imagery Used by Frontex to Detect and Rescue Migrant Boats

While the use by Frontex of satellite imagery is not new, <u>Frontex released a copy</u> of a satellite image used last week to detect and rescue 370 people on board three

inflatable boats off the Libyan coast. (It is unclear whether the image made available by Frontex shows the actual spatial resolution available to Frontex.)

According to Frontex, the imagery is part of "Frontex's Eurosur Fusion Services ... made possible by the cooperation between experts at Frontex and the European Maritime Safety Agency (EMSA), Italian authorities and EUNAVEORMED ... The Eurosur [fusion] services already include automated large vessel tracking and detection capabilities, software functionalities allowing complex calculations for predicting positions and detecting suspicious activities of vessels, as well as precise weather and oceanographic forecasts. Fusion Services use optical and radar

Analysis of a high Resolution Satellite Image

▲ロト ▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ ● 臣 ■ ● の Q (2)

The Satellite Image Data

- A satellite image provided by INFOSAT, covering 500m² of the ocean.
- The image has two components: clouds and water.
- ► The high resolution image (1 pixel = 0.02m²) is divided into 3844 square cells, each packing 16 × 16 pixels.
- Each pixel conveys a gray-level intensity scaled between zero and one.
- our dataset consists of 3844 points in a 256-dimensional square.
- Goal: segment the image into two clusters: the cloud cluster and the water cluster using K-Tau

Outliers in the Satellite Image Data

- A patch of higher altitude clouds bearing large gray-level intensity levels
- The outliers brings up the level of the K-means clouds-cluster center.

- The picture has three components (clusters):
 - shinning metal (SHM)
 - opaque metal (OPM)
 - sand (SND)

Picture Segmentation

From robust and non-robust clustering

(a) Original Image

コン (四) (日) (日) (日) (日) (日)

Ouliers

- 15 % of the OPM-cluster cells are very opaque (right lower corner in the picture)
- ► These cells have unusually low I-levels and high S-levels.
- These outliers upset the K-Means OPM-cluster center.

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Cluster Centers

Effect of Ouliers

- The shaded sand region is assigned to the OPM-cluster by K-means.
- Recomputing the K-means clusters after removing these outliers validates this reasoning.
- Now the K-means results are consistent with those of the robust clustering procedures.

Automatic detection of missing objects

- The robust clustering sorted the cells as follows:
 - ▶ n₁ = 2500 SND-cluster cells
 - n₂ = 405 OPM-cluster cells
 - $n_3 = 329$ SHM-cluster cells
- The screw is made of a material opaque metal that makes up 13% of the image

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

"Geographic" Step

- Restrict attention to the n₂ × 2 Geographic Data Matrix with the position (latitude and longitude) of the OPM-cluster cells
- Perform a second robust cluster analysis on these Geographic data
- Isolated outliers in this second robust clustering are likely to locate the missing piece.
